CHAPTER 1
Introduction

Context and Rationale

The continuous advancement of technology has transformed various processes in education, including student attendance monitoring and record management. Attendance and exit-and-return logging are important school procedures that help maintain accurate student records, ensure accountability, and promote campus safety. In the observed high school, some teachers already utilize QR-code technology for attendance monitoring. However, its implementation is not consistent across all classes, and attendance and exit-and-return records are still managed through separate processes. This situation may lead to inefficiencies in record management, increased administrative workload, and difficulties in monitoring student movement within the school.

Several studies have demonstrated the effectiveness of QR-code technology in educational settings. Lagrada, Ganan, and Falcon (2022) found that the eSAM attendance system successfully digitized attendance monitoring, improved the accuracy of attendance records, and provided immediate notifications regarding students' attendance status. Similarly, Arpon (2022) revealed that a QR-code-based attendance acquisition and monitoring system automated data collection, streamlined administrative tasks, and provided a more efficient means of tracking attendance. Galgo (2020) also reported that the Scan Attendance Manager Application improved student accountability and attendance monitoring through real-time recording and reporting. Likewise, Mendoza and De Torres (2023) found that an automated QR-code attendance monitoring system enhanced attendance management and minimized the limitations associated with traditional paper-based procedures.

Expanding on these findings, local research underscores the broader behavioral and operational benefits of QR scanning in high school classrooms. A study conducted at Tagkawayan National High School revealed a significant positive difference in student attendance before and after implementing a QR-code monitoring system, demonstrating that automated tracking enhances class participation and academic engagement (Tagkawayan Research Team, 2023). Furthermore, research by Alimuran et al. (2024) at Ormoc City Regional Sports Academy demonstrated that learners using a QR-code scanning system achieved significantly higher punctuality rates compared to those monitored via traditional manual logs. Their findings highlighted that the psychological awareness of being digitally tracked effectively improves student compliance while drastically cutting down the instructional time lost to manual roll calls. Beyond punctuality, evaluations of QR-based systems consistently show strong user acceptability, users overwhelmingly acknowledge the superior accuracy and operational efficiency of QR systems over conventional paper logs.

In addition to classroom attendance, managing student movement across campus parameters plays a vital role in school safety. A study on a QR-code-based campus entry and exit monitoring system developed by DMMMSU researchers (2020) demonstrated that automated scanning effectively captures real-time arrival and departure timestamps, ensuring student safety, administrative usability, and efficient record updates.

Although previous studies have established the benefits of QR-code technology in attendance monitoring, they mainly focused on attendance management alone. Limited studies have explored the integration of attendance monitoring and exit-and-return logging within a single mobile application. Moreover, there is little research examining how such an integrated system can improve existing practices in schools where QR-code attendance systems are already partially implemented. As a

result, there remains a need for a centralized and efficient system that can manage both attendance records and student movement monitoring.

To address this gap, the present study aims to improve the efficiency of student attendance and exit-and-return logging through a QR-Code-Based Mobile Application. By integrating these functions into a single platform, the study seeks to enhance the current monitoring practices of teachers, provide more accurate and organized records, reduce administrative workload, and support more effective student monitoring in a high school setting.

Purpose of the Study

This study aims to improve the efficiency of student attendance and exit-and-return logging at Pres. Diosdado Macapagal High School through the development and implementation of a QR-Code-Based Mobile Application. Specifically, it seeks to enhance existing attendance monitoring practices by providing a centralized and automated system that records student attendance and logs students' exit and return transactions accurately and efficiently.

The study is important because monitoring student movement is an essential aspect of school management. Schools have the responsibility to ensure the safety, security, and accountability of students while they are on campus. Accurate records of student attendance and movement allow school personnel to determine whether students are present in class, have left the campus with permission, or have safely returned. However, when records are maintained through separate or partially manual processes, monitoring can become time-consuming and less efficient. Through the proposed QR-Code-Based Mobile Application, attendance monitoring and exit-and-return logging will be integrated into a single platform. This is expected to provide teachers with a faster and more organized way of managing student records while reducing administrative workload and minimizing recording errors.

The findings of this study may benefit teachers by improving the efficiency of attendance and student monitoring. School administrators may benefit from having access to accurate and centralized records that can support decision-making and strengthen student supervision. Students may benefit from a more convenient and reliable logging process, while the school as a whole may enhance campus safety by ensuring that student attendance and movement are properly monitored and documented. Furthermore, this study contributes to the existing body of knowledge on the application of QR-code technology in educational management. It offers an enhanced approach to attendance monitoring by integrating attendance recording and exit-and-return logging into a single system, which may serve as a useful model for other schools seeking to improve their student monitoring practices.

Action Research Questions

This study seeks to determine how a QR-Code-Based Mobile Application can improve the efficiency, accuracy, and organization of student attendance and exit-and-return logging at Pres. Diosdado Macapagal High School.

Specifically, it seeks to answer the following questions:

1. What features should be designed and developed in a QR-Code-Based Mobile Application for student attendance and exit-and-return logging?

2. To what extent does the QR-Code-Based Mobile Application improve the efficiency of attendance recording and exit-and-return logging at Pres. Diosdado Macapagal High School?

3. What is the level of acceptability of the QR-Code-Based Mobile Application in terms of functionality, usability, and reliability as perceived by teachers?

General Objective

The study aimed to develop and evaluate a QR-Code-Based Mobile Application for student attendance and exit-and-return logging at Pres. Diosdado Macapagal High School to improve the efficiency, accuracy, and organization of student monitoring and record management.

Specific Objectives

1. To design and develop a QR-Code-Based Mobile Application for student attendance and exit-and-return logging.

2. To evaluate the effectiveness of the QR-Code-Based Mobile Application in improving the efficiency, accuracy, and organization of attendance and exit-and-return logging at Pres. Diosdado Macapagal High School.

3. To determine the acceptability of the QR-Code-Based Mobile Application in terms of functionality, usability, and reliability as perceived by teachers.

Innovation, Intervention, or Strategy

The innovation proposed in this study is a "QR-Code-Based Mobile Application" for student attendance and exit-and-return logging. The application is designed to improve the efficiency, accuracy, and organization of student monitoring and record management at Pres. Diosdado Macapagal High School. This action research will be conducted at Pres. Diosdado Macapagal High School, where the researchers are currently assigned as pre-service teachers. During the teaching internship, the researchers observed that attendance recording and exit-and-return logging are conducted using varying methods, which may lead to inefficiencies in record management. As pre-service teachers, the researchers will implement the QR-Code-Based Mobile Application in their assigned classrooms to determine its effectiveness in improving existing practices.

The intervention will involve designing and developing the application, generating QR codes for students, conducting system testing, and implementing the application during actual classroom attendance and exit-and-return logging procedures. The researchers will use the application throughout the implementation period and gather feedback from teachers regarding its effectiveness and acceptability. The rationale for this intervention is based on the need to provide teachers with a more efficient and organized method of managing attendance and student movement records. Although some teachers already utilize QR-code technology for attendance monitoring, its implementation is not consistently practiced, and exit-and-return logging is often managed separately. Integrating these functions into a single mobile application may help reduce the time spent on record-keeping, improve data accuracy, and support more effective student monitoring.

The intervention is limited to the classrooms assigned to the researchers during their teaching internship at Pres. Diosdado Macapagal High School. As such, the findings may reflect only the experiences and outcomes observed within the selected classes. Despite this limitation, the proposed QR-Code-Based Mobile Application is considered a practical and feasible strategy for enhancing attendance monitoring and exit-and-return logging in a high school setting. The intervention is expected to contribute to more efficient classroom management and improved record-keeping practices.

Pre-Implementation Phase

The pre-implementation phase focuses on the preparation and planning of the action research. As pre-service teachers assigned at Pres. Diosdado Macapagal High School, the researchers observed the current practices in student attendance and exit-and-return logging within their assigned classrooms. Based on these observations, the researchers identified the need for a more efficient and organized system for monitoring student attendance and movement.

To address this need, the researchers conducted a review of related literature and studies to gather information and identify possible solutions to the problem. The researchers proposed the development of a QR-Code-Based Mobile Application as the intervention for the study. During this phase, the researchers prepared the action research manuscript, secured the necessary permissions from concerned authorities, and sought the evaluation and recommendations of selected expert evaluators regarding the proposed study and planned system development. The comments and suggestions provided by the evaluators will serve as the basis for improving the research design and the proposed application before proceeding to the development and implementation phases. This phase ensures that the study is properly planned and that the proposed intervention is relevant, feasible, and aligned with the identified needs of the classroom setting.

IMPLEMENTATION PHASE GANTT CHART

Stages of Research	W1	W2	W3	W4	W5	W6	W7	W8	W9	W10	W11	W12	W13	W14
Orientation of Participants														
Securing Informed Consent														
Development and Preparation of the Application														
Implementation of the Intervention														
Monitoring														
Adjustment and Improvement														
Assessment of the Intervention														

Figure 1.1. Implementation Phase Gantt Chart

Figure 1.1 presents the timeline of activities for the implementation phase of the study. The process begins with the "orientation of participants in Week 2", during which the researcher introduces the purpose, objectives, procedures, and expectations of the research. This is followed by the "securing of informed consent in Week 3" to ensure that participation is voluntary and that ethical standards are observed. During "Weeks 4 to 6", the researcher conducts the "development and preparation of the intervention", including the finalization of instructional materials, research instruments, and other resources necessary for the study. The "implementation of the intervention" is carried out from "Weeks 7 to 10", where the designed strategy, innovation, or material is administered to the target participants. In "Week 11", monitoring activities are conducted to evaluate the progress of the intervention and gather feedback regarding its effectiveness. Based on the findings from the monitoring process, necessary "adjustments and improvements are made in Week 12" to enhance the implementation. The "assessment of the intervention" takes place in "Week 13", wherein data are collected and analyzed through appropriate evaluation tools to determine the impact and effectiveness of the

intervention. Finally, in "Week 14", the researcher consolidates the findings, prepares the necessary documentation, and completes the required reports, ensuring that the implementation phase is carried out systematically and in accordance with the research framework.

Implementation Phase

The implementation phase will involve the actual utilization of the QR-Code-Based Mobile Application in the researchers' assigned classrooms at Pres. Diosdado Macapagal High School. Prior to the implementation, the researchers will orient the participants regarding the nature, purpose, scope, and timeline of the study. The researchers will also secure the participants' free, prior, and informed consent and ensure that all ethical considerations are properly addressed.

Following the orientation, the researchers will develop and implement the QR-Code-Based Mobile Application for recording student attendance and exit-and-return logs. The application will be utilized during classroom activities to monitor student attendance and movement. Throughout the implementation period, the researchers will document the process, monitor the performance of the application, and make necessary adjustments to improve its effectiveness and usability. Data regarding the effectiveness and acceptability of the system will also be collected from the participants.

The post-implementation phase will focus on the evaluation of the intervention and the completion of the research study. The researchers will consolidate, tally, and analyze the data gathered during the implementation phase using appropriate statistical tools. The results will be interpreted and discussed to determine the effectiveness and acceptability of the QR-Code-Based Mobile Application in improving student attendance and exit-and-return logging.

Based on the findings, the researchers will prepare the remaining sections of the research report, including the presentation, analysis, and interpretation of data, conclusions, and recommendations. The entire manuscript will be reviewed and subjected to evaluation to ensure its accuracy and completeness. Necessary revisions will be made based on the feedback received from evaluators and advisers.

Upon completion of the revisions, the researchers will finalize the action research report and present the findings to relevant stakeholders. The results and recommendations of the study will be disseminated to support the possible utilization of the QR-Code-Based Mobile Application in improving attendance monitoring and exit-and-return logging practices at Pres. Diosdado Macapagal High School. The final manuscript will also be prepared for archiving and future reference.

Post Implementation Phase

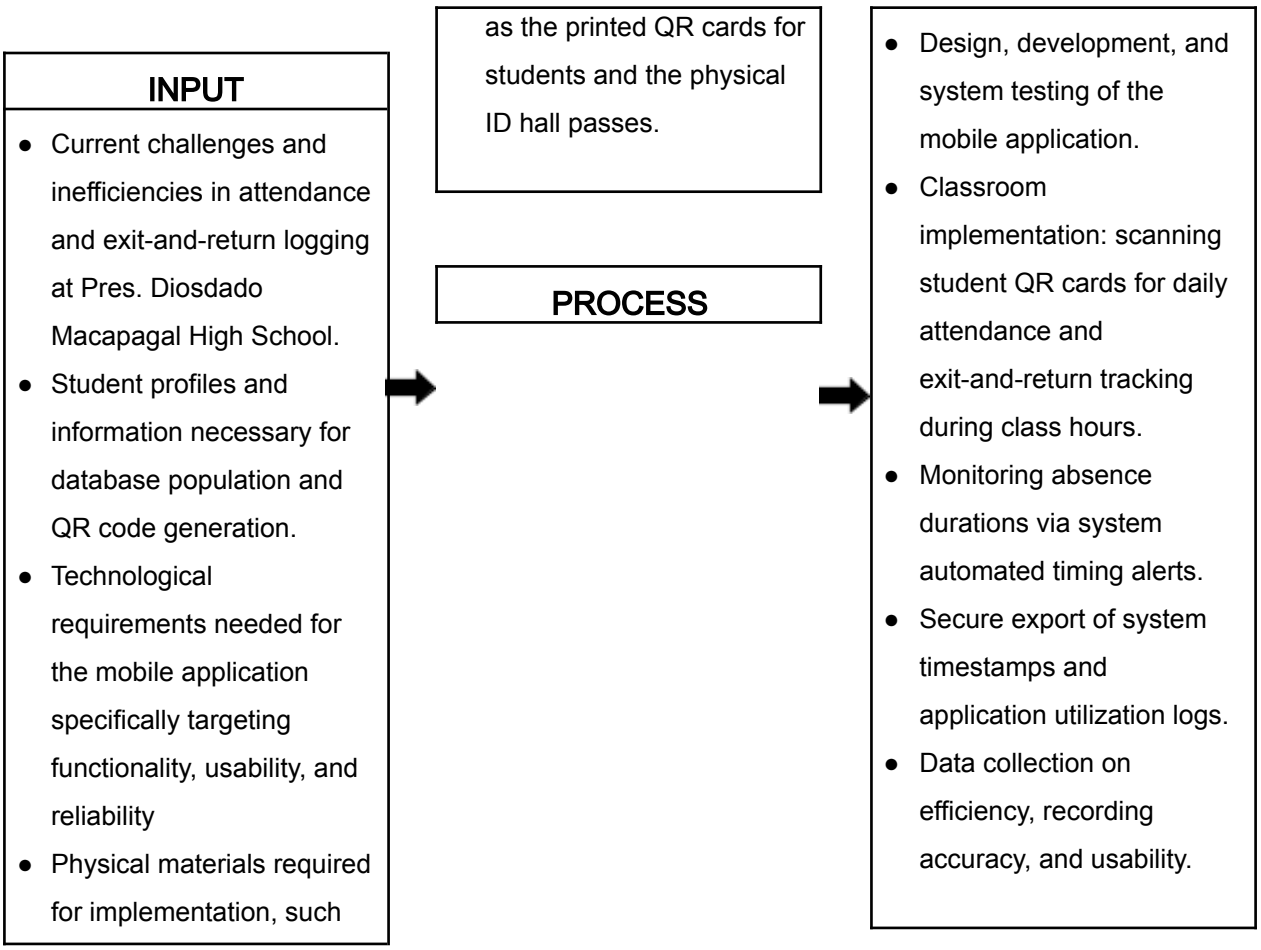

The proponent/s consolidate the results; tally and compute the data using the appropriate statistical tools; analyze and discuss the results; prepare the remaining parts of the report for completion; review the entire work and subject it to critiquing and evaluation; submit the paper to the research committee for final presentation; edit it based on the results of the final presentation; finalize the research report; disseminate and utilize the results; present the results and share the findings and recommendations for utilization; prepare for archival and online publication, etc).

CHAPTER 2
Action Research Methods

This chapter presents and discusses the research design, participants and/or other sources of data and information, data gathering methods, data analysis plan, and ethical considerations. These are explained in detail so that the researchers who will embark on similar work or endeavor can replicate the methods as they are planning to conduct or implement similar interventions.

Conceptual Framework

This study employs the Input-Process-Output (IPO) model to frame the development and evaluation of the QR-Code-Based Mobile Application.

OUTPUT	• An evaluated QR-Code-Based Mobile Application for classroom monitoring. • A centralized, digital record for both classroom attendance and exit-and-return logs. • Streamlined classroom record management and reduced loss of instructional time.

Figure 1.2 Input-Process-Output

The **Inputs** for this research consist of the current challenges in attendance and exit-and-return logging at Pres. Diosdado Macapagal High School, the student profiles needed to populate the database and generate QR codes, the specific technological requirements targeting functionality, usability, and reliability, and the physical materials such as printed QR cards and ID hall passes. To address these inputs, the research process involves designing, coding, and deploying the QR-code activity log and automated timing alert system. This transitions into the classroom implementation phase where pre-service teachers scan student QR cards to log daily attendance and temporary absences while the students wear physical hall passes in the corridors.

The **Process** also includes the collection of operational efficiency logs and functional assessment checklists during daily classroom integration, along with the gathering, tabulating, and statistical treatment of the system data.

Ultimately, these procedures lead to the expected **Outputs** which include an evaluated and highly efficient QR-Code-Based Mobile Application, a centralized digital record for classroom attendance and exit-and-return logs, and improved classroom management alongside enhanced student monitoring through the automated timing alert system.

Research Design

This study utilizes a **Descriptive-Evaluative Action Research Design** to address the current challenges in classroom record management. As action research, the study focuses on solving a specific, localized problem by actively introducing a practical intervention in a real-world educational setting (Faryad, 2018). In this particular context, the intervention is the implementation of the QR-code mobile application during actual classes. The descriptive component is applied to clearly document the current baseline practices of the school and explain the newly engineered features of the digital log system. Furthermore, the evaluative aspect is necessary to assess the overall success of the intervention. By using this combined approach, the researchers can systematically measure the application's performance and level of acceptability in terms of functionality, usability, and reliability based on firsthand classroom implementation data (Garcia & Fombona, 2015).

Participants/ Sampling and/or Other Sources of Data/ Information

participants of this study are selected using purposive sampling and are restricted strictly to the pre-service teachers and their assigned classes at Pres. Diosdado Macapagal High School:

1) **Student Participants**

   The primary subjects for the system implementation will be the students handled by the pre-service teachers at Pres. Diosdado Macapagal High School. They are

purposefully selected because they are the direct end-users whose attendance and exit-and-return activities need to be tracked and monitored during the internship period.

2) **Researcher-Implementers (Pre-Service Teachers)**

The student-teachers themselves serve as the primary evaluators and operators of the application. They will directly manage the system during live class sessions to track student movement, maintain attendance records, and assess the tool's usability and operational efficiency in real classroom conditions

Data Gathering Procedure

To ensure a systematic and rigorous collection of data, the researchers will utilize a triangulated approach involving system utilization logs, direct classroom observation, and a modified Likert-scale survey questionnaire. The data gathering is divided into three distinct phases to align with the action research implementation plan.

Pre-Data Gathering

Before the actual implementation, the researchers will secure the necessary permissions from the School Principal and the Research Head Teacher of Pres. Diosdado Macapagal High School. Upon approval, the researchers will finalize the development of the QR-Code-Based Mobile Application and the automated timing alert system. Individual QR code cards will be generated and printed for the student sections assigned to the pre-service teachers. A comprehensive orientation will be conducted prior to deployment. This orientation will explain the mechanics of the QR scanning process, physical hall pass usage, and ethical guidelines to the students. Finally, the research evaluation metrics and observation tools will be submitted to the research adviser for validation.

Actual Data Gathering

During the implementation phase, During the implementation phase, the mobile application will be integrated into the daily classroom routines of the pre-service teachers' assigned sections. For standard attendance, the students' QR cards will be scanned upon entering the classroom. For exit-and-return logging, when a student asks to leave the room to use the restroom or for other permitted reasons, the pre-service teacher will scan the student's QR card to log the temporary absence. The student will then wear the physical ID hall pass to be easily identified in the hallways by school personnel. The system's automated timing alert will actively monitor the duration of the absence. Throughout the implementation period, system performance metrics, scan responsiveness, error rates, and logging speeds will be continuously logged within the application.

Post Data Gathering

After the implementation period, the system logs containing the timestamp data for attendance and exit-and-return transactions will be securely exported from the mobile application's central database. The gathered quantitative data regarding transaction durations, scan accuracy, and system efficiency will be tabulated and organized into spreadsheets. The exported logs will be compiled to evaluate the system's performance and accuracy compared to baseline manual logging. All raw data will be strictly managed and restricted to the researchers for final analysis. The ultimate users of this synthesized data will be the internal school stakeholders, such as administrators and faculty members, who can utilize the findings to make informed decisions regarding the potential school-wide adoption of the application to improve campus safety and record keeping.

Data Analysis

To systematically answer the action research questions, the gathered data will be analyzed using appropriate descriptive and statistical tools.

For the first research question regarding the system features, a descriptive narrative analysis will be used to outline and document the engineered components of the mobile application, including the centralized database, the QR scanning mechanism, and the automated timing alert system.

For the second question focusing on efficiency improvement, a comparative descriptive analysis will be utilized to examine the system logs. This will involve assessing the time spent recording, the frequency of errors, and the accuracy of tracking compared to the baseline observations of traditional manual logging.

Finally, for the third question regarding the level of acceptability in terms of functionality, usability, and reliability, the quantitative performance metrics and evaluative feedback captured during implementation will be synthesized using descriptive statistics, specifically the weighted mean. The computed mean for functionality, usability, and reliability will be interpreted using a standard descriptive equivalent scale to establish the practical viability of the application.

Ethical Considerations

The researchers adhere strictly to the ethical guidelines and principles in conducting this study involving human subjects (students/pupils/learners), and vulnerable sectors. Moreover, the risk-benefit ratio will be properly weighed and assessed so that the procedures conducted in school remain part of the routine activities and expected actions in the teaching-learning process. Hence, the study is ethically sound to begin with.

The aspects below will also be ensured. The conduct of this classroom-based action research strictly adheres to the ethical standards and research principles governing studies involving human participants, particularly minor learners in basic education. To uphold the rights, welfare, and integrity of all participants, the following protocols are strictly observed:

1. **Informed Consent and Learner Assent** - Because the primary participants include minor learners, formal written parental consent is secured prior to data gathering, generation of QR codes, and intervention implementation. Concurrently, age-appropriate learner assent is obtained from the students, ensuring they clearly understand the purpose, nature, and daily activities of the study, specifically how their attendance and temporary classroom exits will be logged.
2. **Voluntary Participation and Freedom from Coercion** - Participation is strictly voluntary. Students and their parents or guardians are explicitly informed of their right to withhold consent or withdraw from the digital QR logging at any stage without prejudice, academic penalty, or loss of standard classroom privileges, such as the right to use the restroom.
3. **Confidentiality, Anonymity, and Data Privacy** - In strict adherence to Republic Act No. 10173, also known as the Data Privacy Act of 2012, all personal identification, attendance records, and exit-and-return timestamps are handled with rigorous confidentiality. Student identities are protected by assigning unique alphanumeric identification codes within the system database and on all subsequent reports. The master list linking student names to their corresponding codes and QR cards is securely maintained solely by the principal researchers. Digital research records and the application database are password-protected and encrypted, while any

physical records will be retained in secure storage and destroyed once the research evaluation cycle is officially concluded.

4. **Equitable Treatment and Protection from Bias** - The implementation of the QR-Code-Based Mobile Application and the distribution of physical hall passes are administered fairly across all learners. The mechanics of scanning for attendance and logging temporary exits are made explicit and transparent to eliminate educator favoritism, bias, or the marginalization of any student, thereby safeguarding equal opportunity for safe and properly monitored classroom movement.

Informed Consent

Prior to the pre-data gathering phase and the implementation of the QR-Code-Based Mobile Application, formal informed consent protocols will be strictly executed. The researchers will secure written Parental or Guardian Consent forms detailing the nature, purpose, and activities of the classroom action research. Concurrently, age-appropriate Learner Assent will be obtained directly from the students to ensure they comprehend the study, specifically the generation of their personal QR cards and the automated timing alerts, and willingly agree to participate.

During the orientation, it shall be made clear to the participants and their parents that their participation in the study is strictly voluntary. Students retain the right to withdraw from the digital QR monitoring at any time without facing any academic penalties, deductions, or loss of standard instructional support and movement privileges from the pre-service teacher.

Furthermore, the participants will be explicitly informed that the research is conducted solely for academic purposes. The attendance timestamps and exit-and-return logs gathered from them shall be exclusively used for evaluating the

effectiveness and efficiency of the mobile application and will not negatively influence their formal grades in their subjects.

Confidentiality Pledge

We, the researchers, solemnly pledge to uphold the highest ethical standards of confidentiality, academic integrity, and professional discretion throughout the planning, data collection, analysis, reporting, and dissemination phases of this Classroom-Based Action Research.

In strict adherence to the provisions of Republic Act No. 10173, otherwise known as the Data Privacy Act of 2012, and the institutional research guidelines of the Department of Education and the Technological University of the Philippines Taguig, we hereby commit to the following principles and protocols:

1. All participant identities, Learner Reference Numbers, and identifying information will be replaced with alphanumeric codes across all system databases, system logs, and research reports.
2. Attendance data and exit-and-return timestamps will be used solely to evaluate the intervention strategy and the efficiency of the mobile application. This data will never affect students' academic grades or be used for punitive measures.
3. All digital data, including the mobile application database and exported system logs, will be encrypted and password-protected. Physical records will remain locked, and access will be restricted exclusively to the research team.
4. Final findings and presentations will report general class-wide efficiency trends and survey results only; individual learners and their specific movement habits will not be identifiable.

5. All QR master lists, observation sheets, and recorded system logs will be securely deleted or shredded upon the final academic defense and official completion of the study.

Authorization to Access Private Information.

To protect the interests and privacy of all participants, the researchers will strictly adhere to Republic Act No. 10173, also known as the Data Privacy Act of 2012. The researchers will secure formal written authorization from the School Principal of Pres. Diosdado Macapagal High School. This institutional authorization ensures that any pertinent private data—specifically the student profiles needed for QR code generation, classroom attendance records, and exit-and-return timestamps will not be accessed, processed, or transported without explicit administrative approval and corresponding parental consent.

Action Research Methods (30 points)	*Participants and/or other Sources of Data and Information*	Not stated **(0 pts)**	The action research proposal states the target participants and/or other sources of data and information. (ex: learners, teachers, documents, realia, learner's products, others) **(5 pts)**	Details are provided about the target participants. (ex: number, characteristics, sampling procedure, if any) and/or other sources of data and information. Clear rationale for their inclusion in the study is given. **(10 pts)**	10
	Data Gathering Methods	Not described **(0 pts)**	The action research proposal presents a general description of the method(s) to be employed for gathering data. **(5 pts)**	Details of the data gathering method(s) are provided: the specific kinds of data, how and when they will be collected (ex: pretest and posttest scores). Research instruments, if any, are described (ex: test, scale, survey questionnaire, checklist, interview guide, others). **(8 pts)**	The proposal explains why the selected data gathering method(s) is suited to the nature and purpose of the action research. The data gathering method/s is aligned with the research question/s. Research instruments, if any, are appropriate for obtaining the desired kind of data/ information. **(10 pts)**	10
	Data Analysis Plan	Not stated **(0 pts)**	The action research proposal presents a general description of how the gathered data/ information will be analyzed. **(5 pts)**	Details of the method/s of data analysis are given. Techniques (ex: quantitative/statistical, qualitative, or both methods), as well as tools (ex: software) to be employed are specified. **(8 pts)**	The selected method of data analysis is shown to be appropriate to the nature of the data/information to be gathered and for addressing the research question/s. **(10 pts)**	4
Action Research Work Plan and Timelines (5 points)	–	Not included **(0 pts)**	The action research proposal includes a list of major activities and their timelines **(3 pts)**	A detailed work plan is provided covering start to completion of the action research. Timelines are realistic and show concretely how the action research will unfold over the allowed period. The overall plan reflects the proponent's capacity to concretized ideas into clear and sequential steps to be undertaken. **(5 pts)**		5
Cost Estimates (5 points)	–	Not included **(0 pts)**	The action research proposal includes a list of major items and their estimated cost. The total cost is shown. **(3 pts)**	A detailed breakdown of items with their corresponding cost is furnished. The items and costs reasonably reflect the funding needs of the action research and adhere to the BERF guidelines. The overall plan reflects the proponent's capacity to project specific expenses that she or he be accountable for. **(5 pts)**		5
					Total Score	90
